

Frontend Implementation: Syncing the 3-3-1 Waterfall

Context: The backend GuildDistributor.sol has been upgraded to a Triple-Accumulator Waterfall with strict RPG equip limits (3-3-1). We need to update the React frontend (Wagmi/Viem) to handle these new limits gracefully without fundamentally changing the visual design of the Vault.

Task 1: Contract ABI & Address Sync

Since GuildDistributor was rewritten and redeployed in the dev-01 branch, the frontend configuration must be updated.

1. **Update Address:** In src/config/contracts.ts, update the GUILD_DISTRIBUTOR_ADDRESS to the newly deployed Arbitrum Sepolia address.
2. **Update ABI:** Ensure the ABI includes the new read functions:
 - stakedLeadCount(address) returns (uint8)
 - stakedSilverCount(address) returns (uint8)
 - stakedGoldCount(address) returns (uint8)
 - earned(address) returns (uint256)

Task 2: Fetching the Loadout State (Wagmi)

In the main Vault component (e.g., TheVault.tsx), add Wagmi useReadContracts hooks to fetch the user's current loadout limits dynamically.

// Pseudo-code for Wagmi v2 hook

```
const { data: loadoutCounts } = useReadContracts({
  contracts: [
    { address: DISTRIBUTOR, abi: ABI, functionName: 'stakedLeadCount', args: [userAddress] },
    { address: DISTRIBUTOR, abi: ABI, functionName: 'stakedSilverCount', args: [userAddress] },
    { address: DISTRIBUTOR, abi: ABI, functionName: 'stakedGoldCount', args: [userAddress] },
  ]
});
```

```
const [leadCount, silverCount, goldCount] = loadoutCounts || [0, 0, 0];
```

Task 3: Graceful UI Limits (The "Equip Slots")

We must prevent the user from attempting to stake beyond the limit and wasting a signature/transaction.

In the "Wallet Elements" (Unstaked) List:

When mapping through the user's unstaked NFTs, check their Tier against the current loadoutCounts.

- **If Tier 1 & leadCount === 3:** * Disable the Stake button.
 - Change button text to: Max Equipped (3/3)
 - Optional: Add a tooltip: *"You have maxed out your Accessory slots. Transmute these into Silver to increase your yield!"*
- **If Tier 2 & silverCount === 3:**
 - Disable button → Max Equipped (3/3)
- **If Tier 3 & goldCount === 1:**
 - Disable button → Max Equipped (1/1)

Task 4: Real-Time Yield Polling

Ensure the "Total Pending Yield" card correctly polls the new earned(address) function.

1. Use Wagmi's useReadContract mapped to earned(userAddress).
2. Set query: { refetchInterval: 5000 } so the UI ticks up every 5 seconds, giving that satisfying gamified dopamine hit.
3. Format the returned 1e18 uint256 value to a clean 2-decimal format (e.g., 0.02 GOLD) using formatUnits(data, 18).
